

Compact Compression Inc. Releases Newest Addition to Line of Hydraulic Casing Gas Compressors

Calgary, AB – November 15, 2016

Compact Compression Inc. has released the newest addition to its line of Hydraulic Casing Gas Solution Gas compressors. Joining the already popular CHC 615 compressor is the high-volume CHC 1050 compressor.

With nearly triple the capacity of the original CHC 615, the CHC 1050 compressor includes several improvements developed over the last year. The most significant improvement is enhanced cold weather temperature control to maintain optimum hydraulic oil temperatures, over the wide seasonal temperature swings found in the WCSB. Accomplished using automatic dampers and a warm up valve, the temperature control system allows the unit to heat and run without the presence of an operator. The CHC 1050's simple, robust, and low cost design also eliminates the most common failure points of a Hydraulic Casing Gas compressor: pneumatic control valves and liquid separation and handling equipment.

Chris Blundell, President of Company Compression Inc., explains, "Customers enthusiastically accepted the original CHC 615 compressor designed, for single well service and identified several other applications from Pigging to Treater Gas Compression that benefit from the attributes of the CHC 615. Customers then asked for a larger compressor with enough capacity to capture gas from multi-well pads and ESP wells. This provided the motivation to develop the CHC 1050, which significantly improves the economics for larger flows."

The CHC 1050 has all the features that have made the CHC 615 popular including the ability to process unlimited amounts of liquids. The unit is simple and quick to install or move which minimises production losses and associated cost due to service or installation. Further, in the unlikely event of a shutdown, the unit's satellite call out system will instantly notify Compact Compression Service to expedite a response. Less downtime, fewer failures, reduced operating costs and higher capacity is how the new CHC 1050 compressor increases production and profits.

As with every unit produced by Compact Compression Inc., the CHC 1050 continues the theme of reducing hassle for the operator with increased profits and minimal customer investment. Compact Compression Inc. offers flexible and affordable options for both renting and purchasing which includes a fixed monthly cost service plan that covers all process and equipment issues. With the addition of the CHC 1050, there has never been a more hassle-free way to optimize production.

About Compact Compression Inc.

Compact Compression Inc. is a privately owned; Alberta based company engaging in the design, manufacture, and service of low horsepower natural gas compressors. Providing customers with "No Hassle Compression" solutions since 2002, Compact Compression Inc. specializes in economically viable skid and trailer-mounted units for natural gas wellhead and solution gas compression. More information on the company and its product lines can be found at <http://www.compactcompression.com>
